NEW AURA · NORDIC FLOW · ROUND 2

User journey: from loading data to an approved, exported plan

One complete path through the MVP, recorded on the running application with the synthetic demo scenario. Screens are real; figures are synthetic cost units.

WHO
A planner in Company A's Swedish pilot region (simulated), who today allocates goods by habit, one leg at a time.

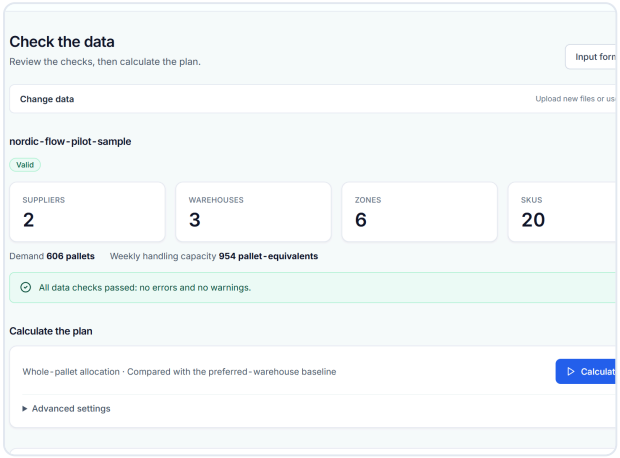

GOAL
Decide which supplier and which existing warehouse should serve each customer zone **at the lowest total cost**, keep control of the result, and be able to show why.

SCENARIO
2 suppliers, 3 existing warehouses, 6 customer zones, 20 products, 606 pallets in one weekly run.

1 Load and check → 2 Calculate → 3 Compare routes → 4 Review → 5 Decide → 6 Approve and export

Steps 1 to 3 on this page, 4 to 6 on page 2

1 Load and check the data

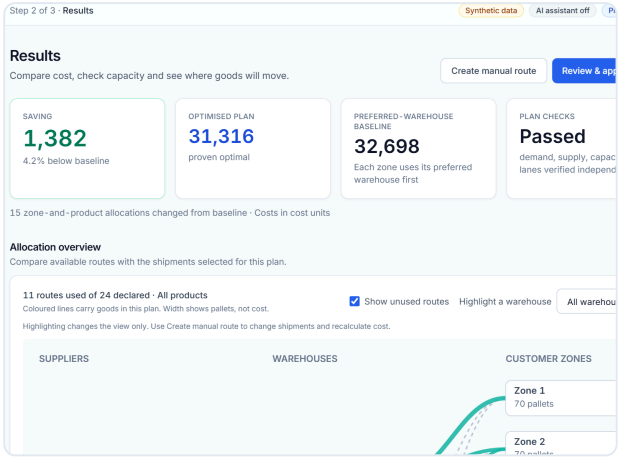

PLANNER Uploads the week's planning files: 8 CSV files, or one ZIP. The demo uses the pilot sample ZIP.

SYSTEM Checks every file before any calculation. Errors block the run, with file, row and message.

RESULT **A valid scenario: 606 pallets of demand, 954 pallet-equivalents of weekly capacity.**

2 Calculate and read the result

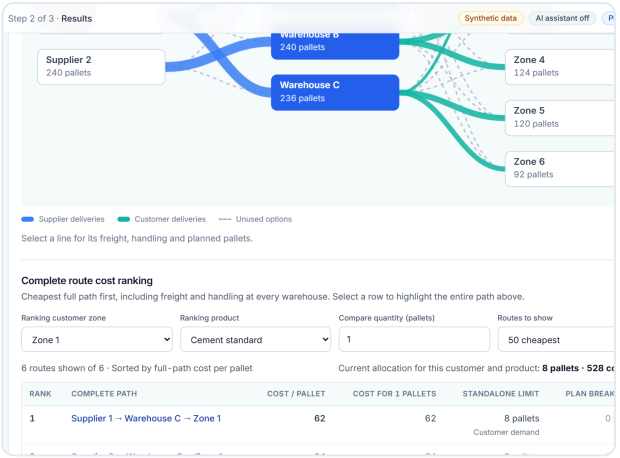

PLANNER Selects Calculate plan.

SYSTEM Builds the preferred-warehouse baseline, solves for the lowest cost, and re-checks both plans independently.

RESULT **31,316 against 32,698: a saving of 1,382 (4.2%), shown only because the baseline is feasible and verified.**

3 See where goods move and why

PLANNER Reads the allocation diagram and the complete route cost ranking for a customer and product.

SYSTEM Prices each full path, supplier to warehouse to customer, with freight and handling at every leg.

RESULT **Evidence for each choice, down to the cost of a single leg. Highlighting never changes the plan.**

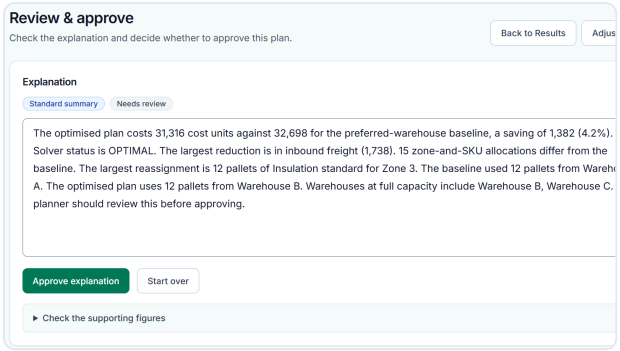

NEW AURA · NORDIC FLOW · ROUND 2

The planner stays in control: review, decide, approve

Steps 4 to 6 of the same journey. A human reads the explanation, can override the machine with a reason, and nothing leaves the system until the plan is approved.

1 Load and check → 2 Calculate → 3 Compare routes → 4 Review → 5 Decide → 6 Approve and export

4 Review the explanation

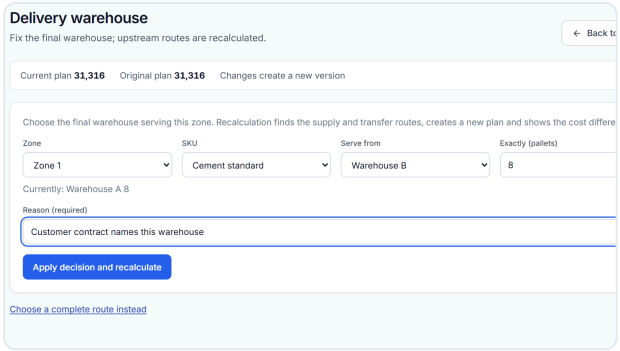

PLANNER Generates an explanation and opens the supporting figures.

SYSTEM Builds the text from calculated numbers. With the optional AI assistant, any figure not in those numbers causes the draft to be rejected.

RESULT **A draft the planner approves, edits or restarts. AI never calculates.**

5 Apply a human decision

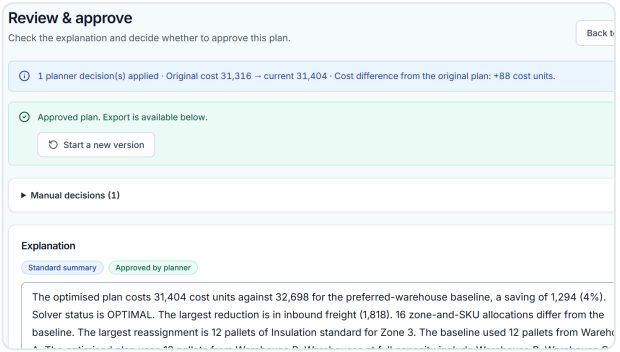

PLANNER Fixes 8 pallets of Cement standard for Zone 1 to Warehouse B, with a required reason.

SYSTEM Re-optimises everything else around the decision as a new version and keeps the original.

RESULT **Plan 2 costs 31,404, which is +88 cost units. The price of the decision is visible.**

6 Approve, export and audit

PLANNER Approves the explanation and the plan, then exports the ZIP.

SYSTEM Locks the plan, enables export only after approval, and records every step in a hash-linked audit trail.

RESULT **A ZIP for the existing ERP, WMS and TMS. Nordic Flow executes nothing.**

31,404
approved plan cost, in cost units

1,294
saving against the baseline (4.0%)

+88
cost of the planner's own decision

Passed
independent checks, audit trail verified

What-if. Close a warehouse on a copy of the data. If no plan can serve demand, the system says so and lists likely causes, never inventing a route.

Start a new version. Approved and rejected plans are locked. A new draft is calculated, and earlier versions stay in the history.

Optional extensions. Transfers between existing warehouses and direct supplier-to-customer lanes switch on only when extra input files are supplied. This journey uses neither.

All data is synthetic. The baseline is a rule that prefers one warehouse per zone, not Company A's actual plan, and the saving is not a forecast for Company A.
